Summary

Data Scientist with **2+ years across Google, ICCC Bharat, and Philips**, spanning across **product analytics, machine learning, and Generative AI**, from launch-stage funnel and churn analysis for a Google product to **agentic and RAG pipelines** for Ads abuse detection, recognised with **two Google Peer Bonuses**. Builds end-to-end, from **SQL/BigQuery pipelines and statistical testing** to **imbalanced-data classifiers and quantized on-device LLMs**.

Experience

Google — April 2025 – October 2026

***Data Scientist**, Ads Account Take Over/Scaled Abuse* — *Hyderabad, India (On-Site)*

- Engineered a data pipeline to ingest and cleanse high-volume Account Takeover (ATO) data for Google Ads, replacing manual workflows for **860+ reviewers**.
- Ran statistical tests (t-tests) to validate removing **30+ redundant features** from ATO Incident Observations, improving data quality and cutting reviewer analysis time by **60%**.
- Developed a Gemini-based agentic pipeline grounded in Actor Threat Intelligence to improve training and calibration data for anti-abuse models, automating **66%** of ATO pattern detection.
- Built a Weekly Business Review for Ads Fraud leadership using a RAG pipeline over operational resource-utilisation tables, quantifying **$90M+** in potential fraud losses, **$75M+** in recoverable revenue, and reviewer headcount needed to meet target response rates.

***Product Data Scientist**, Windows Desktop Google App (20% Project)*

- Partnered with product managers on the launch strategy for the **Windows Desktop Google App**, delivering onboarding-funnel, retention, and user-behaviour analyses that shaped pre-launch product decisions.
- Analysed the app's onboarding funnel to identify technical and accessibility blockers, isolating **8% retention** and a **73% user drop-off** after search-profile creation.
- Redesigned onboarding around the most-used Search verticals based on a deep-dive into user queries, lifting retention from **8% to 14%** and reducing funnel drop-off by **52%**.
- Built a user-level churn classification model using Gradient Boosting on engagement signals from simulated pre-production releases, forecasting post-update retention within **±2 pp** of actuals to assess each fix's impact before rollout.

ICCC Bharat — October 2024 – March 2025

Analytics Engineer — *Bengaluru, India (On-Site)*

- Designed and implemented a **dynamic map dashboard prototype**, providing users with instant access to college data through interactive location markers, cutting information retrieval time by 50%.
- Built a Random Forest classifier to predict a student's probability of admission from competitive-exam scores, achieving **77% precision**.
- Developed an interactive chatbot interface on the main website to collect user responses through a form within the interface, **increasing lead generation by 80%.**

Philips — January 2024 – July 2024

Data Scientist Intern — *Chennai, India (On-Site)*

- Performed **exploratory data analysis** on the supply chain's customer experience data, to **identify 6 KPIs** based on Billing Disputes, Project Schedule and Delivery Performance.
- Centralized the fragmented reporting system by building a **dashboard app in PowerBI**, and utilizing PowerAutomate pipelines to collect data from SharePoint directory, reducing manual data work by 30-35%.
- Constructed a **logistic regression model** to identify drivers of project-schedule errors, reducing planning errors by 14%.

Skills

Languages/Libraries: Python, SQL, Pandas, NumPy, Matplotlib, Scikit-Learn, HuggingFace Transformers.
Tools: PowerBI, Tableau, Alteryx, BigQuery, Vertex AI, Google Cloud Platform, Jupyter Notebook, Git, Microsoft Excel.
Functional Areas: Statistical Analysis, Data Visualisation, Predictive Analytics, Business Analysis, Decision Analytics, Generative Artificial Intelligence, Data Engineering.

Education

Manipal Institute of Technology — September 2020 – July 2024

Bachelor of Technology (B.Tech) — *Manipal, India*

Projects

Bankruptcy Prediction for Financial Institutions | *Random Forest, XGBoost, SMOTE, Scikit-Learn*

- Built a bankruptcy prediction model on a highly imbalanced dataset (**3% bankrupt**), benchmarking **Random Forest and XGBoost with SMOTE oversampling and undersampling** on a stratified hold-out set.
- Best model (Random Forest + SMOTE) identified **60% of bankrupt firms** with a **PR-AUC of 0.31, 10× the base rate**; evaluated on recall and PR-AUC instead of accuracy, which a predict-all-solvent baseline already scores at 97%.

On-Device Contextual RAG for Finance | *Qwen1.5, Llama.cpp, FAISS*

- Architected a **dual-memory RAG system** using **local FAISS indices and MiniLM embeddings**, keeping all data on-device with no cloud round-trips.
- Optimized mobile inference by **compiling and quantizing the Qwen1.5 LLM** to GGUF format, enabling real-time, privacy-centric analysis on edge devices.

Achievements

- **2x Peer Bonus: Google** – Awarded by Senior Peers at Google for the Execution and Launch of ATO NoteMaker **[2026]**
- **HelloAI Hackathon** – Shortlisted as one of the top 100 teams across India for the Finals, at Google **[2025]**
- **CSAW CTF** – Part of one of the **Top 15 Teams in India** for CSAW CTF Finals **[2022]**
